INFECTION CONTROL REQUIREMENTS

1. For all construction work within the hospital, contractors must follow infection control procedures as required by :
   a. CSA Standards Z317.13.12 "Fundamentals For Infection Control During Construction, Renovation and Maintenance of Health Care Facilities" and this project is classified as :
   b. Northern Health Clinical Practice Standard "Infection Control During Construction, Renovations, and Maintenance of Health Care Facilities"
   c. This project is classified as :
   Population Risk Group = **3 (Diagnostic Imaging)**
   Construction Activity Types = **D (Major Renovation)**
   Guidelines for Infection Control Measures = **Class IV**
2. Preconstruction Meeting :
   a. Before commencement of construction, contractor must set up a preconstruction meeting with the hospital to review and obtain approval for the proposed infection control measures.
   b. Contractor to coordinate with Northern Health Authority and the hospital and submit a "Risk Reduction Measures Construction Report" to Northern Health for approval
3. Contractors to observe the following Infection Control precautions for working at the discharge openings of rooftop exhaust ducts.
   a. Infection Control requires that workers must be made aware of the fact that hospital exhaust ducts may carry dust and spore particles, however, not active TB. Dust and spores, residing in these ducts, may be discharged to the exterior with the air mass created within these ducts.
   b. Although the level of risk for potential contamination is low, it is advisable that construction worker's, especially those who are sensitive to respiratory illnesses, wear appropriate dust masks capable of filtering fine particulates.

GENERAL NOTES

1. The tenant improvements shown on these drawings have been designed in accordance with the British Columbia Building Code 2012 and will not adversely affect the seismic capacity of the existing building.

2. Read structural drawings together with architectural, mechanical and other drawings for detail dimensions, duct work, recesses, inserts and other items. In the event of discrepancies between drawings, the more stringent requirements shall be followed.

3. Verify all dimensions and examine site conditions prior to fabrication of all items to ensure correct fit.

4. For conditions not explicitly shown, contractor shall immediately request clarifications from the structural engineer.

5. All connection details to the existing building shown on these drawings are subject to verification of existing conditions on site. Field conditions may require modified or alternate details to be issued by the structural engineer. For conditions not explicitly shown, details to be similar to those shown on the drawings.

6. Provide adequate shoring or bracing during construction to resist all forces including forces such as wind, seismic and unbalanced forces due to construction sequence.

7. Observe and enforce all construction safety measures required by the Worker's Compensation Board of British Columbia and Part 8 of the British Columbia Building Code 2012.
Employ a qualified professional specialty Engineer registered in British Columbia for the design of all falsework and temporary support of all structural elements, earth banks, roads, etc. It is the sole responsibility of the Contractor to ensure that no part of the work is subjected to a load which will endanger the safety of the building or workers. Use temporary bracing where necessary to support all loads to which structure may be subjected, including erection equipment and construction operations.

8. Field Reviews
Provide a minimum of 24 hours notice to the Engineer for routine field review of:
core, cutting, and anchor marked locations, prior to coring, drilling, and cutting
drilled anchor holes prior to installing anchor or adhesives and anchors prior to concealment
unistrut framing prior to concealment

The Contractor is responsible for pre-inspecting the work to confirm completeness prior to field review by the Engineer.

Mark results from scan and proposed locations of cuts and cores for review by the engineer prior to cutting. Do not over-cut corners or edges of openings. At corners, core hole tangent to corner and saw cut remainder of cut. Use small tools as necessary to complete work. Cut material into pieces that can be transported to their disposal outside the building without overloading the floor structures. Where reinforcing steel bars are cut, touch up ends of bars with zinc-rich paint. See plans for additional notes for coring and cutting.

15. Equipment Installation
Handle and install equipment in accordance with all applicable instructions by equipment manufacturer. See plan for travel path inside building.

GENERAL NOTES

1. THE MECHANICAL SYSTEM SHALL CONSIST OF ALL THE WORK SHOWN ON DRAWINGS, SCHEMATICS, AND AS DESCRIBED IN SPECIFICATIONS.
2. INSTALL ALL MECHANICAL WORK AS HIGH AS POSSIBLE, TIGHT TO STRUCTURE ABOVE, EXCEPT WHERE CONFLICT OCCURS WITH REQUIREMENTS LISTED UNDER SPECIFICATION (VIBRATION ISOLATION).
3. THE MECHANICAL PLANS ARE DIAGRAMMATIC IN NATURE AND DO NOT ATTEMPT TO SHOW ALL REQUIRED OFFSETS. REFER TO ARCHITECTURAL AND STRUCTURAL DRAWINGS FOR CONSTRUCTION DETAILS.
4. ITEMS NOTED "TYPICAL" OR "TYP" ON ANY SHEET APPLY TO THAT PARTICULAR SHEET.
5. COORDINATE WITH SPECIFICATION. IN CASE OF CONFLICT BETWEEN SPECIFICATIONS AND DRAWINGS THE MORE STRINGENT SHALL APPLY.
6. PROVIDE ELECTRICAL CODE MINIMUM HORIZONTAL AND VERTICAL WORKING CLEARANCE FOR ALL ELECTRICAL PANELS AND EQUIPMENT. OFFSET MECHANICAL AS REQUIRED.
7. COORDINATE ALL MECHANICAL WORK WITH THAT OF OTHER TRADES TO ENSURE PROPER AND ADEQUATE INTERFACE OF THEIR WORK WITH THE WORK OF THIS CONTRACTOR. PROVIDE COORDINATED SHOP DRAWINGS PRIOR TO FABRICATION AND INSTALLATION.
8. MECHANICAL EQUIPMENT SHALL NOT BE USED FOR TEMPORARY HEAT DURING CONSTRUCTION.
9. ALL DUCTWORK SIZES SHOWN ARE INSIDE CLEAR DIMENSIONS. ADD APPROPRIATE DIMENSION FOR INSULATION OR DUCT LINER TO OBTAIN "TOTAL" DUCT SIZE.
10. INSTALL FIRE DAMPERS AT ALL LOCATIONS WHERE DUCTS PENETRATE FIRE RATED WALLS OR OCCUPANCY SEPARATION WALLS. DAMPER FIRE RATING SHALL BE 1–1/2 HOUR UNLESS NOTED OTHERWISE. COORDINATE DAMPER ACCESS WITH ARCHITECT.
11. REFER TO ARCHITECTURAL REFLECTED CEILING PLANS AND ELEVATIONS FOR EXACT LOCATION OF ALL DIFFUSERS AND GRILLES.
12. MAXIMUM FLEXIBLE DUCT LENGTH SHALL BE 5'–0" WITH 0.5 X DUCT DIAMETER OFFSET UNLESS NOTED OTHERWISE.
13. CONTRACTOR TO REFER TO SPECIFICATIONS FOR TYPE OF DUCT CONSTRUCTION ALLOWED.

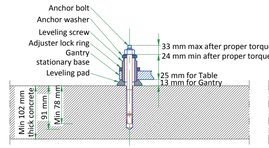
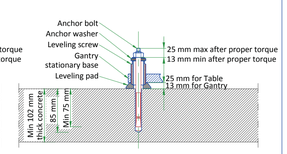
FLOOR REQUIREMENTS

GE SUPPLIED ANCHORS (2106573)



GE SUPPLIED ANCHORS (5487992-2)



FINISHED FLOOR REQUIREMENTS

- Installation requires a finish floor in the scan and control rooms
- The floor surface in the scan room directly under the gantry and table must be level.
- The floor levelness tolerance of the floor surface that the gantry and table will rest on is 6 mm over a 3000 mm distance.
- Shims should not be used to compensate for a floor that does not meet this requirement.
- Eight or more floor covering openings that are 101.6 mm in diameter are made to ensure the table and gantry rest on a solid surface. These floor penetrations can be sealed if required.
- The distance from central line of anchor to the edge of concrete basement of Gantry/table should not be less than 178 mm.
- These requirements apply to all installation types.

RADIATION PROTECTION LAYOUT

SHIELDING REQUIREMENTS SCALING

140 kV	1.00

10 mm aperture	0.38
15 mm aperture	0.48
20 mm aperture	0.59
30 mm aperture	0.79
40 mm aperture	1.00

SHIELDING REQUIREMENTS:

Engage a qualified radiological health physicist to review your scan room shielding requirements, taking into consideration:

- Scatter radiation levels within the scanning room
- Equipment placement.
- Weekly projected work-loads (number of patients/day technique (kvp*ma))
- Materials used for construction of walls, floors, ceiling, doors, and windows.
- Activities in surrounding scan room areas.
- Equipment in surrounding scan room areas (e.g., film developer, film storage)
- Room size and equipment placement within the room relative to room size.

The Illustrations on this page depict measured radiation levels within the scanning room, while scanning a 32 cm CTDI phantom placed on the patient table and using a large filter, with the technique shown. Use the mAs, kV and aperture scaling factors in the table shown here to adjust exposure levels to the scan technique used at the site.
Example: (using the Illustration) The exposure level for a 120 kV, 800mA, 1 sec. scan at 1270 mm (50 in) away from the scan place is 10.4 µGy x 0.71 x 800/100 = 59.2 µGy.

NOTE: Actual measurements can vary. Expected deviations equals ±15%, expect for the 5 mA and 1mm techniques, where variations may be greater (up to a factor of 2), due to the inherent deviation in small values. The maximum deviation anticipated for tube output equals ±40%.

POWER REQUIREMENTS

POWER SUPPLY	**3 PHASES+N+G 380/400/420/440/460/480 V ± 10%**
FREQUENCIES	**50/60Hz ± 3Hz**
MAXIMUM POWER DEMAND	**150 kVA**
AVERAGE (CONTINUOUS) POWER DEMAND	**11 kVA**
POWER FACTOR	**0.85**

- Power supply should come into a power distribution box (PDB) containing the protective units and controls.
- The section of the supply cable should be calculated in accordance with its length and the maximum permissible voltage drops.
- There must be discrimination between supply cable protective device at the beginning of the installation (main low-voltage transformer side) and the protective devices in the PDB.

SUPPLY CHARACTERISTICS

- Power input must be separate from any others which may generate transients (elevators, air conditioning, radiology rooms equipped with high speed film changers...).
- All equipment (lighting, power outlets, etc...) installed with GE system components must be powered separately.
- Phase imbalance 2% maximum.
- Transients must be less than 1500V peak. (on a 400V line)

GROUND SYSTEM

- System of equipotential grounding.
- Equipotential: The equipotential link will be by means of an equipotential bar. This equipotential bar should be connected to the protective earth conductors in the ducts of the non GE cableways and to additional equipotential connections linking up all the conducting units in the rooms where GE system units are located.

CABLES

- Power and cable installation must comply with the distribution diagram.
- All cables must be isolated and flexible, cable color codes must comply with standards for electrical installation.
- The cables from signaling and remote control (Y, SEO, L...) will go to PDB with a pigtail length of 1.5m, and will be connected during installation. Each conductor will be identified and isolated (screw connector).

CABLEWAYS

The general rules for laying cableways should meet the conditions laid down in current standards and regulations, with regard to:

- Protecting cables against water (cableways should be waterproof).
- Protecting cables against abnormal temperatures (proximity to heating pipes or ducts).
- Protecting cables against temperature shocks.
- Replacing cables (cableways should be large enough for cables to be replaced).
- Metal cableways should be grounded.

FEEDER TABLE

MIN. FEEDER WIRE SIZE, AWG OR MCM (sq. mm)/VAC	MINIMUM FEEDER WIRE LENGTH - ft (m)							
	50 (15)	100 (30)	150 (46)	200 (61)	250 (76)	300 (91)	350 (107)	400 (122)
480 VAC	1 (45)	1 (45)	1 (45)	1 (45)	1 (45)	1/0 (55)	1/0 (55)	2/0 (70)
GENERAL NOTES								
In all cases qualified personnel must verify that the feeder (at the point of take-off) and the run to the CT system meet all the requirements stated in the PIM								
For a single unit installation, the minimum transformer size is 225KVa, with 2.4% rated regulation at unity power factor. Resultant maximum allowable feeder regulation is 3.6%								
Grounding conductor will be a 1/0 minimum. this ground will run from the equipment back to the power source/main grounding point and always travel in the same conduit with the feeders

Adequate delivery route from truck to final place of installation has been reviewed with all stakeholders, all communications/notifications have occurred, arrangements have been made for special handling (rigging, elevator, fork lift, etc.). All floors along delivery route will support weight of the equipment, temporary reinforcements arranged if needed.		
System power & grounding (PDB/MDP) is available as per GE specifications, installed at point of final connection and ready to use. Lock Out Tag Out is available.		
System power and grounded audit has been scheduled to be completed during installation of equipment. (If Required) GEHC PM to confirmed if needed.		
Adequate room illumination installed and working.		
Cable ways (floor/wall/ceiling/Access Flooring) are available for installation of GE cables and are of correct length and diameter. Cable ways routes per GE Final drawings and cable access openings areas installed at a time determined by GEHC PM. Surface floor duct can be installed at time of system installation.		
HVAC systems Installed, and the site meets minimum environmental operational system requirements.		
Network outlets installed and computer network available and working.		
Hospital IT/connectivity contacts have been engaged and information has been added to Project management tool. (If Required)		
Customer supplied countertops where GE equipment will be installed are in place.		
Floor levelness/flatness is measured and within tolerance, and there are no visible defects per GEHC specifications. Floor Strength and thickness have been discussed with customer/contractor and they have confirmed GE requirements are met.		
Specific for CT & X-ray		
Doors and windows complete or scheduled to be installed. If applicable, radiation protection (shielding) finished & radioprotection regulatory approval for installation obtained.

Electrical installations
Connection for Class I systems

Fixed rail systems
Fixed rail systems must be connected by Guldmann Service Team or by a qualified installer. A Guldmann class I transformer must be used. Installation to follow existing rules for authorized electricians and according to IEC/UL 60601-1.

Protective ground must be available and connected correctly. From the "connecting point/neutral point" protective ground to rail maximum permissible resistance is 0.2 Ohm.
See "Instructions: Connecting protective ground to rail".
See wiring diagram: "Classification of Transformer Class I for Guldmann Hoist System - Permanent installation with protective ground on rails".

(Classification of Guldmann Hoist System Class I - Permanent installation with protective ground on rails)

Connection of Power Supply Class I for Guldmann rail System - Permanent installation with protective ground on rails

Terminals on transformers Class I
Double-insulated UL approved cable must be used (Cable specification: UL category: AVLV2, min.300V, min. 80 °C, min. 16AWG (1 mm²)).

Transformer DK-13991
In:
Terminal 1 = N
Terminal 2 = 100-115V AC
Terminal 3 = 230V AC
Terminal 4 = Protective ground

Out:
Terminal 5 = 33V AC
Terminal 6 = 33V AC

Note:
Avoid contact to the terminals in the fuse holder when replacing fuses. There can be a risk of electrical shock, if the power supply is not disconnected.
